

Atlas

INTELLIGENCE FOR AFRICAN REAL ESTATE

The AI that tells land developers which plot to buy — 30 seconds, ranked, with the data to back the pick.

THE WEDGE

Land for development. Vacant plots, zoning, size, price. Sub-verticals: residential, commercial, agricultural, industrial, mixed-use, civic. Day-1 product is in market. Wedge region: South Africa, Zambia, Kenya, Nigeria. Expanding.

THE MARKET

- \$1T+ African real estate market, 80% unserved.
- \$250B land-for-development slice — the highest-margin, lowest-competition segment.
- Existing tools give listings, not recommendations. Search, scroll, no AI ranking.
- Atlas is the first to combine AI reasoning + live POI density + suburb-level demographics in one answer.

WHAT ATLAS DOES TODAY

- User asks: "Where in Sandton for vacant land to build 3-bedroom houses?"
- Atlas returns 5 ranked sites in ~30 seconds. Each site shows: AI score (0–1) + confidence, real coordinates on a Mapbox dark map, live POI density (schools, transit, shopping, restaurants), suburb-level demographics (median household income, professional share, growth rate, economic zone), and a rationale explaining the pick.
- User can rate each result (thumbs up/down + note). Every rating teaches Atlas which recommendations actually work for African land developers.

TECH

Next.js 15 + React 19 + Tailwind + Clerk + Mapbox GL. Next.js Route Handlers + Prisma + PostgreSQL (Supabase). Pluggable AI layer: Google Gemini 3.5 Flash, OpenRouter (Llama 3.3 70B, Qwen 2.5 72B), curated stub fallback. Connectors: OpenStreetMap Overpass (live POI), suburb-level Stats SA Census 2022 demographics, real estate listings, Google Places. Hosted on Vercel (auto-deploy on push).

THE ASK — \$1M SEED AT \$5M POST

- \$400k engineering — 2 senior engineers × 18 months.
- \$300k data licensing — Stats SA premium, Google Places API, HERE Maps traffic, Lightstone / TPN.
- \$200k GTM — 1 sales rep in SA, 1 in Kenya, content + community.
- \$100k reserve.
- Month 6 — 50 paying customers, \$12k MRR.
- Month 12 — 200 paying customers, \$50k MRR, sales hire.
- Month 18 — 1,000 customers, \$250k MRR, Series A ready.

DEFENSIBILITY

The moat is proprietary data Atlas accumulates over time. Every question + every rated result becomes a training signal. After 1,000 searches, Atlas knows which sites in Sandton actually got developed. After 10,000, it can predict pre-development land price appreciation. After 100,000, it becomes a market intelligence platform — not a search tool.
